

SERVICE BULLETIN NO. 160

Instructions for filling descaling agent into the steam generator of a Visual Cooking II oven

As a result of the new design and location of the steam generator, it is not possible anymore to pour the descaling agent into the steam generator through the exhaust tube.

Now, you must remove the side plate, disconnect the level hose from the upper elbow screw-joint and pour descaling agent into the steam generator by means of a funnel or the like, as shown in the photo.

The amount of descaling agent used should correspond to the capacity of the steam generator in question (see below).

Steam generator	Amount of water
9-18 KW:	5.1 l
27 KW:	7 l
36 KW:	9 l

Best regards
